

Acer cappadocicum Rubrum

Red Cappadocian Maple

Acer cappadocicum Rubrum field grown

Acer cappadocicum Rubrum is a majestic tree/shrub that has a neat, round canopy. The 5-lobed leaves are a lovely plum colour at first, turning to green in the summer and gradually turning yellow in the autumn before they drop.

Due to its slender branches, *Acer cappadocicum Rubrum* is ideal for any sunny sheltered position and can often be found in a tree grouping in parklands, as a specimen planting on a large lawn or as an avenue or roadway.

Acer cappadocicum Rubrum will generally grow in most soils and as a result of this and the interest it brings to the landscape with its three seasons of colour it has won the RHS award of Garden Merit (AGM).
