

Glorious autumn colours of Cotoneaster 'Cornubia'

This vigorous semi evergreen plant is normally grown as a large shrub, but here at Deepdale we also have *Cotoneaster cornubia* available as a standard tree.

With a mature height of 6-8m, the branches are upright when young but are fast growing so soon become arching and graceful. It can be an excellent specimen or screening tree in a smaller garden.

Year round interest is provided by rich green pointed leaves, clusters of small creamy-white flowers in June and masses of bright red berries in autumn which the birds will love. This variety is noted as being the best *Cotoneaster* for fruit, with the largest and most abundant of the species.

During the autumn the leaves also develop hints of yellow and red autumn colour. Please note that this is only semi-evergreen in a sheltered location.

Will do best in a well drained soils and planting in groups with similar species increases the production of fruit.

Plant Profile

Name: *Cotoneaster x watereri 'Cornubia'*

Family: Rosaceae

Height: 6-8m

Demands: Well drained soil, best in a sheltered location

Foliage: Dark green foliage, elliptical to a point

Flower: Flat heads / clusters of small white flowers in June

Fruit: Abundance of red berries in autumn, often weighing down the already arching branches.

The best Cotoneaster for largest and plentiful fruit
